D6	Rischio Idrogeologico (RI)	The risk is defined as the probable number of victims, damaged buildings, economic activities and infrastructures in a given area and in a given time interval, as a function of the hazard, the vulnerability and the exposure. The hazard is defined as the probability of occurrence of a potentially damaging phenomenon of a given magnitude within a given time interval and in a given area. The vulnerability is the degree of loss of a given element at risk (or group of elements at risk) resulting from the occurrence of a phenomenon of a given magnitude, and is expressed on a scale from 0 (no damage) to 1 (total loss). The exposure is the number of elements at risk (persons, buildings, economic activities, etc.) that are present in the area affected by the phenomenon.
